The global Stern Mounted Sonar System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Stern-mounted sonar system is a maritime technology used for underwater detection and navigation. Installed at the stern (rear) of a vessel, it emits sonar pulses into the water, receiving echoes to create a detailed map of the underwater environment. This aids in detecting obstacles, marine life, and navigational features, contributing to safe navigation, fisheries research, and defense applications. The stern placement allows for efficient coverage and minimizes interference from the vessel's hull, ensuring accurate and reliable sonar readings.

The industry trend for stern-mounted sonar systems involves advancements in integration, miniaturization, and multi-functionality. Modern systems are designed to seamlessly interface with other navigation and communication technologies, providing a comprehensive situational awareness solution. There's a focus on enhancing imaging capabilities for improved target discrimination and underwater mapping. Additionally, the trend includes the development of autonomous and unmanned underwater vehicles equipped with stern-mounted sonar systems, facilitating efficient and cost-effective marine operations. This reflects a broader push for smart and connected technologies in maritime applications, enhancing safety and operational efficiency.
