The global Stimulated Raman Amplifier market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A stimulated raman amplifier is an optical amplifier based on raman gain, which results from the effect of stimulated Raman scattering. The Raman-active medium is often an optical fiber (possibly a highly nonlinear fiber), although it can also be a bulk crystal, a waveguide in a photonic integrated circuit, or a cell with a gas or liquid medium. An input signal can be amplified while co- or counterpropagating with a pump beam, the wavelength of which is typically a few tens of nanometers shorter. For silica fibers, maximum gain is obtained for a frequency offset of 10–15 THz between pump and signal, depending on the composition of the fiber core.

United States market for Stimulated Raman Amplifier is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
