The demand for stool softeners is largely associated with the increasing incidence of constipation. Geriatric patients present a widespread presence of cases of constipation as compared to the younger population. This is due to the lack of physical activity, lack of proper diet, consumption of low-fiber foods, presence of illness and the use of prescribed drugs, which leads to a rise in demand of stool softeners in this population group.

The prevalence rate of constipation is reported to be between 11%-38%, according to the National Institute for Clinical Excellence. Constipation due to pregnancy, and menopausal cases with fluctuations of hormonal levels has also boosted the use of stool softeners globally.

Furthermore, eating disorders sedentary lifestyle, stress, inadequate fluid intake and endocrine or metabolic disorders among many other factors are responsible for the uptake of stool softeners to administer relief over a short-term phase of use.
