A straight vibration feeder is a device that feeds parts by vibrating a straight chute. The chute feeds the aligned parts to the next process. It serves as a buffer and is often used in combination with a Straight Feeder, but it can also be used as a stand-alone device by tilting it.

Straight Feeder can be divided into three types: fixed type, rubber foot type, and plate spring type. As with parts feeders, there are electromagnetic and piezoelectric drive systems. Straight Feeder is often used as one element of Parts Feeder and feeds parts aligned by Bowl Feeder in a straight line.

The parts are then fed to the next process. They are also useful when feeding parts from the parts feeder hopper to the bowl feeder.

The global Straight Feeder market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
