The global Straight Forging Press market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The straight forging press is a type of machine used in the metal forging industry to shape and form metal workpieces through the application of mechanical force. It is a specialized equipment designed specifically for the forging process. The press consists of a fixed bed or anvil and a moving ram or hammer that applies vertical force onto the workpiece. This vertical force is generated by a hydraulic system or mechanical drive, such as a crankshaft or eccentric mechanism. The press may also have auxiliary equipment like die holders, heating elements, and cooling systems for specific forging requirements. Straight forging presses are commonly used for various forging operations, including closed-die forging, open-die forging, and upset forging. They are capable of generating high forces to deform and shape the metal workpiece. The tonnage capacity of these presses can vary depending on the size and requirements of the forging project. The market prospect for straight forging presses is primarily driven by the demand for forged metal components in industries such as automotive, aerospace, energy, and manufacturing. These presses offer precise control over the forging process, resulting in high-quality parts with excellent mechanical properties. The ability to handle different materials and produce complex shapes makes straight forging presses versatile and valuable in the metalworking industry. The market for straight forging presses is expected to grow steadily due to the increasing adoption of advanced manufacturing techniques and the need for efficient, reliable, and cost-effective forging solutions. Technological advancements in machine design, control systems, and automation further enhance the capabilities and productivity of these presses.
