The global Straw Briquette Fuel market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Straw briquetting fuel is a renewable energy source made from crop straws after compression molding. With the improvement of environmental awareness and the continuous development of new energy technologies, the market prospects of straw briquetting fuel are gradually broad. The renewable and environmentally friendly properties of straw briquette fuel are its main features. Straw is an abundant renewable resource, and a large amount of crop straw is discarded or burned every year, which not only causes a waste of resources, but also produces serious air pollution. By compressing straw into blocks, it can be converted into a clean form of energy, replacing traditional fossil energy such as coal and oil, thus reducing environmental pollution.
