There are two main stress-strain test methods, contact and non-contact. The sensor test represents the contact measurement method. In this method, strain gauges need to be arranged before the test, and the wires will be routed. Balanced by the Wheatstone bridge module, it can be converted into a corresponding voltage signal. After passing through the analog/digital circuit inside the tester, the voltage signal can be converted into a digital signal, and then the special software can be used to capture and Analyze these signals. There is also an optical strain measurement system, which is a non-contact measurement method. The measurement process is relatively simple, and the test process data can be viewed repeatedly.
