Strip Lamination Ultrasonic Inspection System is a specialized non-destructive testing (NDT) system designed to detect lamination defects within metal strips, such as steel or aluminum, during or after the manufacturing process. Laminations are internal separations or layers within the material that can significantly weaken its structural integrity. This system uses high-frequency ultrasonic waves, typically through immersion or water jet coupling, to scan the strip's cross-section for signs of these defects. Advanced transducers and signal processing software enable real-time evaluation and precise defect localization across the strip's width and length. Commonly integrated into continuous production lines, this system ensures product quality and compliance with industry standards in sectors like automotive, construction, and metal fabrication.
