Peeling corrosion inhibitor is a coating used to prevent corrosion and oxidation of metal surfaces. It has excellent corrosion resistance and weather resistance, which can effectively protect the metal surface from chemical substances and natural environment erosion. Peeling corrosion inhibitors are typically a multi-layer coating system that includes primers, intermediate layers, and topcoats. During the coating process, it is necessary to pay attention to the following points: the metal surface should be smooth, clean, and free of impurities such as oil and dust. The primer should fully adhere to the metal surface and have excellent corrosion resistance. The intermediate layer and topcoat should be fully compatible with the primer and have excellent weather and corrosion resistance. During the coating process, the amount of coating should be controlled to avoid excessive or insufficient use. After coating, a certain curing time should be carried out to ensure the optimal performance of the coating. It should be noted that the stripping corrosion inhibitor needs to be thoroughly stirred before use to ensure that the pigments and fillers in the coating are fully dispersed. Meanwhile, due to the possibility of harmful substances in the paint, corresponding safety measures should be taken, such as wearing gloves, masks, etc. If it is necessary to repair or replace the peeled corrosion inhibitor, the old coating should be thoroughly removed first and then repainted.
