Stromal Vascular Fraction (SVF) is a heterogeneous mixture of cells obtained from adipose tissue (commonly known as body fat). These cells include adipose stem cells, endothelial cells, endothelial progenitor cells, pericytes, T cells and other immune cells.

The therapeutic potential of SVF is primarily attributed to the presence of adipose-derived stem cells (ADSCs) and their ability to differentiate into various cell types, such as osteocytes, chondrocytes, and muscle cells.

SVF therapy is a treatment that utilizes stromal vascular components, a heterogeneous mixture of cells obtained from adipose tissue, to address a variety of medical conditions by exploiting their regenerative and immunomodulatory properties.
