## Abstracts

The global Strong Anion Exchange Chromatography Resin market size is predicted to grow from US\$ 421 million in 2025 to US\$ 747 million in 2032; it is expected to grow at a CAGR of 8.6% from 2026 to 2032.

Strong anion-exchange chromatography media are liquid-phase separation materials based on porous microsphere supports such as agarose, methacrylate polymers, polystyrene-divinylbenzene (PS-DVB), silica, or cellulose. These matrices are functionalized with strongly basic, permanently charged ligands such as quaternary ammonium groups, trimethylammonium ethyl groups, or quaternized polyethyleneimine derivatives. Unlike weak ion exchangers, these ligands retain positive charge across a wide pH range, enabling robust electrostatic interactions with negatively charged biomolecules. They are used for capture, polishing, and analytical separation of proteins, antibodies, viral vectors, plasmid DNA, oligonucleotides, and related impurities. The estimated gross margin is approximately 58%.

Strong anion-exchange media are a high-stickiness consumable within downstream bioprocessing and biomolecule analytics. While their market size is smaller than Protein A affinity resins and general reversed-phase chromatography media, they play a critical role in antibody polishing steps, host cell protein and residual DNA removal, and the purification of viral vectors and nucleic acid therapeutics. Purchasing decisions are driven by dynamic binding capacity, salt tolerance, flow rate performance, batch-to-batch consistency, and regulatory documentation rather than unit price alone.

Demand growth is primarily driven by the scale-up of monoclonal antibody production and the increasing use of AAV, plasmid DNA, mRNA, and oligonucleotide-based therapies. In these processes, strong anion-exchange resins are commonly used for

polishing and flow-through impurity removal. Although they may not represent the highest volume step in every workflow, their integration into validated manufacturing processes creates high switching costs and stable repeat demand.

The competitive landscape is led by global suppliers such as Cytiva, Thermo Fisher, Merck, Tosoh, and Bio-Rad at the high-end process level. Domestic manufacturers are accelerating substitution through agarose and polymer-based platforms and scaled manufacturing capabilities. Future opportunities lie not in commoditized Q-type resin expansion, but in high salt-tolerant, high-flow, large-pore, low-leachate, and fully validated process-grade products suitable for regulated biomanufacturing environments.
