The structured light projector is a device designed to project a specific pattern of light field. It utilizes an internal optical system and a light source to emit light with a particular spatial structure (such as stripes, grids, etc.) onto the surface of a target object. The projected structured light pattern will deform due to the shape and depth information of the object's surface. By analyzing the deformed structured light pattern and employing corresponding algorithms, accurate three-dimensional morphological information of the object can be obtained. It is widely used in fields such as three-dimensional reconstruction, industrial inspection, and machine vision, providing an efficient and precise means of acquiring object spatial information.

Typical products include: Bestintech's PJTRS, etc.

United States market for Structured Light Projector is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
