The global Stud Marine Chain market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

According to the structure of the anchor chain loop, anchor chains can be divided into two types: Stud Chain and Studless Chain. The chain links of the anchor chain with stops are equipped with crossbars. When the size and material are the same, the strength of the anchor chain with stops is greater than that of the anchor chain without stops, the deformation is smaller, and it is not easy to twist when stacked. It is widely used by modern large and medium-sized ships. The chain link of an unsecured anchor chain does not have a crossbar and is generally only suitable for small ships. According to the relevant regulations, when the diameter of the anchor chain equipped as required does not exceed 17mm, an ungraded anchor chain with equal test load or a steel wire rope or fiber rope with equal breaking load can be used instead of a graded anchor chain. The steel grades used for producing graded anchor chains are M1, M2, and M3 for welded anchor chains, and M2 and M3 for cast steel anchor chains. Adding A (such as AM2) before the corresponding level code indicates the presence of a gear chain, while B indicates the absence of a gear chain (with BM1 and BM2 levels). The higher the grade of steel, the greater the tensile strength. AM1 grade anchor chain steel is quenched steel, while AM2 and AM3 grade anchor chain steel are fully quenched and refined treated steel. For the same vessel, if high-strength steel is used, the size of the anchor chain ring can be appropriately reduced.
