The global Submarine Communication Photonics Mast and Antenna market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The main advantage of using a Photonics Mast is that, unlike a periscope, it doesn't penetrate the submarine's hull. Conventional periscopes may be visible when raised, creating a risk of detection. However, the Photonics Mast raises the water in a telescoping motion, only penetrating the sail. This eliminates the need for a large opening in the hull and also limits the risk of water leaks in the event of damage. The structural stability of the submarine has also been improved.
