Subsea grab refers to a specialized tool or device used in underwater operations to perform tasks such as dredging, excavation, or debris removal on the seabed. A subsea grab is primarily used for gathering or removing materials, objects, or sediment from the seabed. It is commonly employed in offshore construction, underwater mining, oil and gas industry, or environmental cleanup operations. A subsea grab typically consists of a large mechanical grab or clamshell-like structure with robust jaws or teeth that can firmly grasp and secure objects or sediments on the seabed. It may be operated remotely by hydraulic or electric controls, depending on the depth and scale of the operation. Subsea grabs are utilized for various tasks, including seabed clearance, pipeline and cable burial, seabed leveling, debris or object retrieval, and even trenching in certain cases. They are especially useful in areas where other methods, such as dredging pumps or excavators, may not be suitable or accessible.

The size and capacity of subsea grabs can vary widely, depending on the specific application and requirements. Some grabs may be relatively small and operated by remotely operated vehicles (ROVs) for lighter tasks, while others can be large and mounted on heavy-duty underwater construction equipment.
