Subsea injection manifold system refers to a complex arrangement of pipes, valves, and other equipment used in offshore oil and gas production operations for the subsea injection of fluids. This system is typically employed to inject various substances, such as chemicals for well stimulation, water for enhanced oil recovery, or gas for gas lift operations, into the subsea reservoir. The subsea injection manifold system enables the controlled delivery of these fluids from the surface production facilities to the target well or wells on the seafloor. It consists of multiple injection lines that are connected to the production flowlines or subsea umbilicals, which supply the necessary fluid or gas.

Valves and control systems are incorporated to regulate the flow, pressure, and volume of the injected fluids. The subsea injection manifold system plays a crucial role in maintaining and optimizing the production and recovery rates of offshore oil and gas reservoirs.
