According to this study, the global Subsea Tree Systems market size will reach US\$ 5409 million by 2031.

This report focuses on Subsea Tree Systems (sometimes called Christmas tree, etc.). In petroleum and natural gas extraction, a Christmas tree, or 'tree', is an assembly of valves, spools, and fittings used to regulate the flow of pipes in an oil well, gas well, water injection well, water disposal well, gas injection well, condensate well and other types of wells. It was named for its resemblance to the series of starting lights at a drag racing strip (Christmas tree (drag racing)).

The primary function of a tree is to control the flow, usually oil or gas, out of the well. Christmas trees are used on both surface and subsea wells. It is common to identify the type of tree as either 'subsea tree' or 'surface tree'. Each of these classifications has a number of variations. Examples of subsea include conventional, dual bore, mono bore, TFL (through flow line), horizontal, mudline, mudline horizontal, side valve, and TBT (through-bore tree) trees.
