The global Suction Manifolds market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The suction manifold, also called suction hood, is used to distribute the main air flow from the ducting of a woodworking machine to the different extraction points installed by the manufacturer of this machine. There may be multiple extraction points of varying diameters, as is the case with wide belt sanders, for example.

Oil and gas companies are focusing on improving operational efficiency and reducing costs. Technologies such as data analytics, artificial intelligence, and automation are being employed to optimize production, enhance asset performance, and streamline operations. Energy efficiency measures are also being adopted to reduce environmental impact and improve sustainability. The oil and gas industry is witnessing a shift in investment priorities. Companies are increasingly allocating capital towards projects with shorter payback periods, lower breakeven costs, and higher returns on investment. This includes investments in unconventional resources, offshore deepwater projects, and natural gas developments.
