The global Super Micro-porous Carbon Brick market size is predicted to grow from US\$ 165 million in 2025 to US\$ 212 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

Super Micro-porous Carbon Brick is a carbon-based refractory brick engineered with an extremely fine pore structure to deliver high thermal resistance, strong corrosion resistance, and improved durability in harsh high-temperature environments. By controlling pore size distribution and bonding structure, it reduces pathways for slag and metal penetration while maintaining the thermal shock resistance and mechanical strength needed for repeated heating and cooling cycles. These materials are typically designed for demanding furnace and vessel linings where insulation, chemical stability, and service life are critical to operating reliability. The unit price of Super Micro-porous Carbon Brick is typically around \$2,000 per ton, and the industry gross profit margin is usually between 15% and 25%.

The upstream supply chain includes carbon raw materials such as calcined anthracite, petroleum coke, graphite, and carbon black, along with binders like coal tar pitch or resin, anti-oxidation additives, and process aids, plus crushing, milling, sieving, and blending services. Midstream manufacturers shape bricks through pressing or extrusion, then cure and heat-treat them under controlled conditions and conduct quality inspection for density, porosity, strength, and oxidation resistance. Downstream customers are heavy high-temperature industries including steelmaking and ironmaking operations, nonferrous metallurgy, glass and ceramics producers, and other industrial furnace operators, where procurement is driven by lining performance, campaign life, energy efficiency, and total maintenance cost.

United States market for Super Micro-porous Carbon Brick is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
