The global Supercapacitor Cell market size is predicted to grow from US\$ 968 million in 2025 to US\$ 1515 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Compared with batteries and other capacitors, although it has the characteristics of fast charging and fast discharging, good temperature characteristics, green environmental protection and long service life. However, its energy density is low, and it is difficult to use it as an energy storage device alone, and its permeability in practical applications is low. This is also one of the main reasons why we were optimistic about this industry before 2016, but the later development was slow. Because low power and low energy density limit the application scenarios of the product. With the development of materials and technologies in the future, supercapacitors with high power and high energy density will be a major trend in the future.

Different applications have different demand for the technology research and development of products. At present, there are no monopoly companies in the market, and the distribution of downstream demand is wide. Focusing on a competitive advantage in a specific field is a better development direction.

For example, Ningbo CRRC New Energy Technology is mainly concentrated in rail transportation. Shanghai Aowei Technology is mainly concentrated in rail trams, tunnel locomotives, new energy buses.

Theoretically, the larger than the surface area, the greater the capacity, but in fact, it usually only improves the quality ratio, the more important volume than the capacity, and the conductivity decreases. Studies have found that although the carbon material on the surface of high ratio has a large ratio area, the actual utilization rate is not high, because the pores are different in the pore carbon material, divided into micropores (

50nm), and only holes greater than 2nm (water system) or 5nm (non -water system) are beneficial to form a dual electrocomputer, so the pore diameter distribution should be adjusted while increasing the surface area. In addition, the surface performance (functional group), conductivity, and apparent density of carbon materials also affect the performance of capacitors.

Develop low -resistant composite materials to improve the conductivity of the material. It is good to compatible with electrolytes and improves the cycle life of super capacitors. The research of supercapacitors electrode materials will focus on the development of existing material preparation processes and structural optimization. It also has the development of new materials for Latie capacitance and dual -layer capacitors. Cost and performance needs to stabilize mobile power technology.

Although the supercapacitor industry has maintained a rapid development trend, the industry standards are in urgent need of improvement, which will play a positive role in regulating the production and quality control of supercapacitors and promoting the development of the supercapacitor industry.
