The global Superconducting Magnets market size is predicted to grow from US\$ 3309 million in 2025 to US\$ 3766 million in 2031; it is expected to grow at a CAGR of 2.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A superconducting magnet is an electromagnet made from coils of superconducting wire. They must be cooled to cryogenic temperatures during operation. In its superconducting state the wire has no electrical resistance and therefore can conduct much larger electric currents than ordinary wire, creating intense magnetic fields. Superconducting magnets can produce greater magnetic fields than all but the strongest non-superconducting electromagnets and can be cheaper to operate because no energy is dissipated as heat in the windings. They are used in MRI machines in hospitals, and in scientific equipment such as NMR spectrometers, mass spectrometers, fusion reactors and particle accelerators.

The global market for superconducting magnets is predicted to witness a progressive growth in the next few years. The growing demand from the medical devices market is one of the key factors that are likely to encourage the growth of the market in the next few years. In addition, the rising number of applications in the healthcare sector, such as magnetic resonance imaging is expected to generate promising opportunities for market players operating in the global superconducting magnets market in the near future.
