The global Supercritical CO2 Extraction Equipment market size is predicted to grow from US\$ 72.3 million in 2024 to US\$ 115 million in 2030; it is expected to grow at a CAGR of 8.0% from 2024 to 2030.

Supercritical carbon dioxide extraction is a commonly used method to separate various components from the plant due to it producing a pure, clean, and safe product. Carbon dioxide reaches a supercritical state at 1071 psi and 31.1°C. When a molecule is in a supercritical state, it has properties of both liquid and gas.

The Supercritical CO2 Extraction System combines carbon dioxide, pressure, and temperature to separate specific compounds in plant materials for extraction.

Supercritical carbon dioxide (supercritical CO2) is a fluid in a special state with unique properties such as high diffusivity and low surface tension. It has shown wide application value in many fields.

In the field of application, supercritical CO2 extraction technology is undergoing significant technological optimization and innovation. By improving equipment design and optimizing process parameters, such as more accurately controlling extraction temperature, pressure, time and CO2 flow, extraction efficiency can be further improved and costs reduced.

In terms of equipment performance, supercritical CO2 extraction equipment is developing towards intelligence, automation, miniaturization and portability. This not

only improves the stability of production and consistency of product quality, but also meets the needs of laboratory research, pilot production and some special application scenarios. At the same time, the stability and durability of the equipment are also enhanced, with better materials selected and the equipment structure optimized.
