## Abstracts

The global Supercritical CO<sub>2</sub> Extraction System market size is predicted to grow from US\$ 77.32 million in 2025 to US\$ 131 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

Supercritical carbon dioxide extraction is a commonly used method to separate various components from the plant due to it producing a pure, clean, and safe product. Carbon dioxide reaches a supercritical state at 1071 psi and 31.1°C. When a molecule is in a supercritical state, it has properties of both liquid and gas.

The Supercritical CO<sub>2</sub> Extraction System combines carbon dioxide, pressure, and temperature to separate specific compounds in plant materials for extraction.

Supercritical carbon dioxide (supercritical CO<sub>2</sub>) is a fluid in a special state with unique properties such as high diffusivity and low surface tension. It has shown wide application value in many fields.

In the field of application, supercritical CO<sub>2</sub> extraction technology is undergoing significant technological optimization and innovation. By improving equipment design and optimizing process parameters, such as more accurately controlling extraction temperature, pressure, time and CO<sub>2</sub> flow, extraction efficiency can be further improved and costs reduced.

In terms of equipment performance, supercritical CO<sub>2</sub> extraction equipment is developing towards intelligence, automation, miniaturization and portability. This not only improves the stability of production and consistency of product quality, but also meets the needs of laboratory research, pilot production and some special application

scenarios. At the same time, the stability and durability of the equipment are also enhanced, with better materials selected and the equipment structure optimized.
