Running shoes are divided into three parts: upper, midsole, and outsole. The role of the midsole is to provide stability, cushioning and rebound, absorb the impact generated during exercise, and provide protection and a relatively mild foot feel during exercise. The midsole is the soul of running shoes and the core symbol that distinguishes major manufacturers. Supercritical foam running shoe technology is an advanced shoemaking process that uses supercritical fluid technology to manufacture materials into midsoles. Supercritical fluid refers to a gas or liquid near a critical point under high pressure and high temperature conditions, and has different properties from both gases and liquids. Supercritical fluids have high diffusion rates, low surface tension, and low viscosity and can quickly drill and fill materials, forming tiny bubbles. These tiny air bubbles provide excellent cushioning and comfort through the material's intricate structure.

The global Supercritical Fluid Foam Shoe Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
