Supercritical point dryers use the characteristics of supercritical fluids to dry porous materials, especially those with high specific surface area, low density, and low thermal conductivity, such as aerogels. This drying technology can effectively maintain the structure of porous materials without causing shrinkage or fragmentation. In the supercritical state, the fluid has no clear liquid-gas interface, so there is no liquid surface tension, thus avoiding the shrinkage and deformation of the sample due to surface tension. Due to the above characteristics, the supercritical point dryer can maintain the true morphology of the sample during the drying process, which is especially important for samples that need to retain microstructures (such as biological samples, micro-nano 3D structure samples, etc.).

The global Supercritical Point Drying Instrument market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
