The global Supplementary Cementing Materials (SCMs) market size is predicted to grow from US\$ 46956 million in 2025 to US\$ 70421 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Supplementary Cementing Materials (SCMs) are mineral-based cement substitutes or reactive fillers used in concrete and blended cement systems to partially replace clinker or Portland cement while improving durability, workability, later-age strength, and carbon efficiency. Their key advantage lies in reducing cement consumption, lowering embodied carbon, and enhancing performance through pozzolanic or latent hydraulic reactions. In 2025, the capacity utilization rate was 73%, and the industry average gross margin was approximately 28%. Production in 2025 totaled 600 million tons, with an average price of USD 80 per ton.

Supplementary Cementing Materials will become a core material solution for cement producers, ready-mix concrete plants, precast manufacturers, and infrastructure contractors seeking lower-carbon and higher-performance concrete systems. Their application value is strongest in mass concrete, bridges, tunnels, commercial buildings, marine engineering, and public infrastructure, where durability, thermal control, permeability reduction, and long-term strength matter more than simple material substitution. As cement companies move from clinker expansion to carbon-efficient formulation, suppliers with stable ash, slag, silica fume, and natural pozzolan resources, together with grinding, activation, blending, and quality-control capabilities, can build stronger customer stickiness and margin resilience.
