SAW (Surface Acoustic Wave) is an elastic wave that propagates only in the vicinity of a piezoelectric material surface. The nature of the propagation of elastic waves near a solid surface, one of which is a gas, a liquid, a vacuum, or another solid material, is different from that of infinitely expanding (bulk) solids, liquids, or gases. In particular, when the solid substrate material is a piezoelectric material, the piezoelectric effect (piezoelectric effect) generates a surface acoustic wave (SAW) that propagates near the surface in a specific direction when subjected to strain. The propagation speed of a SAW is about 1 to 5 km/s, about 1/100,000th of the speed of electromagnetic waves, making it possible to miniaturize the circuit.

The global Surface Acoustic Wave (SAW) Device market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
