Surface Analysis System has established that surfaces are fundamental in the performance of modern materials, our attention turns to the techniques available for surface characterisation. To understand and develop new materials and surfaces properties we need techniques which will measure only the first few nanometers of the surface as opposed to several microns, or bulk material. The primary techniques used for surface analysis are X-ray photoelectron spectroscopy (XPS), sometimes also known as electron spectroscopy for chemical analysis (ESCA), time-of-flight secondary ion mass spectrometry (ToF-SIMS) and Auger electron spectroscopy (AES). Each of these three techniques provide slightly different, complementary, information but has in common that the information comes from the first few nanometers of the material.
