Surface finish comparators are tools that quantify the surface quality of a material that has undergone machining and surface finishing processes. Each manufacturing process has a specific surface finish comparator scale that when placed adjacently to a finished workpiece offers insight into the material integrity of the workpiece. Comparators include a value index to compare substrates relative to each other. These devices are no replacement for the accuracy of profilometers, but can be used for quick reference, as well as certified to provide a ranged measurement.
