The global Surface Transceiver market size is predicted to grow from US\$ 293 million in 2025 to US\$ 417 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Surface transceiver is an underwater acoustic communication device installed on surface vessels such as ships, buoys, and drilling platforms. Their core function is to exchange wireless data with underwater vehicles, seabed sensors, and other equipment, acting as a communication gateway between the surface and underwater environments. They solve the interconnection problem between two heterogeneous communication networks above the surface (radio/satellite) and below the surface (underwater acoustic), serving as a crucial hub for cross-media remote control, data transmission, and real-time monitoring. The upstream supply chain mainly includes high-precision transducer arrays, watertight electronic components, and deck unit control systems; downstream applications widely cover offshore oil and gas extraction, offshore wind power construction, submarine communication, and national defense underwater security, providing critical command and control links for various underwater operational equipment. In 2025, the production of surface transceivers is estimated at approximately 200,000 units, with an average price of approximately US\$1,500 per unit, a gross profit margin of approximately 30%, and a single-line capacity of 2,500 units per year.

United States market for Surface Transceiver is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Surface Transceiver is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
