According to our LPI (LP Information) latest study, the global Surfacing Composite Pipe market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Surfacing Composite Pipe is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Surfacing Composite Pipe market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Surfacing Composite Pipe are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Surfacing Composite Pipe. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Surfacing Composite Pipe market.

Surfacing composite pipe is a layer of special alloy for anti-corrosion, anti-wear or other modification purposes deposited on the surface of the pipe by surfacing welding technology, so as to ensure that the pipe can be used under special working conditions such as strong corrosion and easy wear.

In recent years, with the continuous improvement of the calorific value of domestic waste and the working parameters of boilers, the corrosion and wear problems of waste incineration waste heat recovery boilers have become increasingly prominent. The speed of corrosion and wear has continued to accelerate, significantly reducing the

service life of boiler components. Due to the high cost of frequent replacement of related components, waste incineration power generation enterprises initially adopted thermal spraying technology to protect the boiler, but the coating and the substrate in thermal spraying technology are mechanically bonded with low bonding strength, and the coating is relatively thin and Porosity is prone to appear, resulting in poor protection effect. Therefore, waste incineration power generation companies began to look for better solutions. Since surfacing technology can achieve a metallurgical bond with high bonding strength between the surfacing layer and the base material, the surfacing layer can achieve a specific thickness without the presence of pores, and in foreign countries Waste incineration waste heat recovery boilers have good applications. Domestic waste incineration power generation companies have begun to switch from thermal spray protection technology to surfacing protection technology.
