The header is a box connected to the boiler tube, which has the functions of collecting and distributing working fluid and extracting steam, and is one of the most important pressure-bearing parts of the boiler. The heating surface of the header arranged in the furnace has been exposed to high temperature, high pressure and complex flue gas environment for a long time, and is extremely susceptible to corrosion and wear. The surfacing header is to use the surfacing technology to deposit alloy materials with certain performance on the heating surface of the header, so that the heating surface of the header has special properties such as anti-corrosion, anti-wear, high temperature resistance, and high pressure resistance.

My country's '14th Five-Year' Urban Domestic Waste Sorting and Treatment Facilities

Development Plan' and other documents have clearly put forward the phased goals of domestic waste incineration capacity and proportion of urban domestic waste incineration, and with the development of economy and urban population The amount of waste generated in cities continues to grow. As an important infrastructure for urban waste removal and transportation, waste incineration power plants need to match their overall construction progress nationwide with the increase in waste generation and disposal needs. This demand is Objective existence. Therefore, in the short and medium term, the number of new waste incineration power plants to be built in my country will still be relatively large, which will continue to drive the development of the upstream anti-corrosion and anti-wear industry.
