A surgical helmet system (SHS) is either a loose-fitting hood or a hood combined with an integral gown (called a toga system). SHSs are used during orthopedic procedures to decrease the patient's risk of deep wound infection by keeping skin and other particles from the surgeon's face from falling into the open surgical site. They are also used to protect surgical staff from infectious blood splashes and potentially infectious aerosols generated by power tools during orthopedic procedures.

For many years, orthopedic surgeons have been using surgical helmets as personal protection against blood-borne pathogens during arthroplasty surgery. The original purpose of surgical helmets was to protect patients from particles that the surgical team might emit into the wound. Additionally, surgical helmets will protect the surgeon from

direct body fluid contamination.
