Cryoablation is a surgical technique that uses cryoablation to eliminate target tissue. Compared with previous radiofrequency ablation, patients in cryoablation do not have to

endure high temperature and reduce pain. Its principle is to take away the heat of tissue through the heat absorption and evaporation of liquid refrigerant, reduce the temperature of target ablation site, and destroy the abnormal electrophysiological cell tissue, thus reducing the risk of arrhythmia. [1]

A large number of clinical data show that compared with traditional radiofrequency ablation, cryoablation is easier for doctors to operate, shorten the operation time, have high treatment effectiveness, and reduce serious complications such as thrombus, and reduce patient pain.
