A surgical mesh sling is a medical device used primarily in the treatment of stress urinary incontinence (SUI) and pelvic organ prolapse (POP). The sling is typically made from a synthetic mesh material, such as polypropylene, and is designed to support the urethra or bladder neck to prevent involuntary leakage of urine during activities that put pressure on the bladder, like coughing, sneezing, or lifting. During the procedure, the mesh sling is surgically implanted to create a hammock-like support, which helps to maintain proper positioning of the urethra and bladder. This minimally invasive surgery has become a common treatment option due to its effectiveness and shorter recovery time compared to more traditional surgical methods.

The global Surgical Mesh Sling market size is projected to grow from US\$ 651 million in 2024 to US\$ 968 million in 2030; it is expected to grow at a CAGR of 6.8% from 2024 to 2030.
