A Surgical Suction Liner is a disposable medical liner used with surgical suction systems to collect blood, body fluids, irrigation fluids, and other liquid waste generated during medical procedures. It is placed inside a suction canister and forms a barrier between the collected material and the reusable container. The liner is designed to provide secure fluid containment, prevent contamination of suction equipment, reduce cleaning requirements, and simplify medical-waste disposal. Depending on the design, it may include suction ports, patient tubing connections, filters, overflow protection, and sealing structures. It is primarily used in operating rooms and other clinical settings where surgical fluid aspiration is required.

The upstream industry supplies medical-grade polymer films, plastic components, tubing, connectors, filters, valves, sealing materials, and packaging materials. The midstream industry processes these materials through film forming, molding, cutting, heat sealing, component assembly, leak testing, sterilization where required, and

packaging. Finished liners are differentiated by capacity, material structure, connection configuration, filtration and overflow protection, and equipment compatibility. Downstream demand comes from hospitals, surgical centers, emergency departments, and other healthcare facilities using suction systems for fluid collection during surgical and clinical procedures.

United States market for Surgical Suction Liner is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
