The global Sustained-release Microspheres market size is predicted to grow from US$ 285 million in 2025 to US$ 373 million in 2031; it is expected to grow at a CAGR of 4.6% from 2025 to 2031.

Sustained-release microspheres are specialized drug delivery systems designed to provide controlled and prolonged release of therapeutic agents after injection. These microspheres, typically made from biodegradable polymers like poly(lactic-co-glycolic acid) (PLGA), encapsulate drugs and gradually release them over days, weeks, or even months as the polymer degrades. This technology enhances patient compliance by reducing the frequency of injections, ensures steady drug levels in the bloodstream, and minimizes side effects associated with peak drug concentrations. Sustained-release microspheres are widely used in fields such as oncology, endocrinology, neurology, and infectious diseases, offering benefits in treating cancer, diabetes, schizophrenia, and chronic infections.
