PDLC (Polymer Dispersed Liquid Crystal) and SPD (Suspended Particle Device) are both electrically controlled switchable films, which are widely used in the fields of automobiles, construction, etc. to adjust light. Switchable PDLC Film is a mixture of low-molecular liquid crystal and prepolymer. Under certain conditions, polymerization reaction occurs to form micron-sized liquid crystal droplets, which are evenly dispersed in the polymer network. Then, the dielectric anisotropy of the liquid crystal molecules is used to obtain a material with electro-optical response characteristics. It mainly works between the scattered state and the transparent state and has a certain grayscale. Polymer dispersed liquid crystal film is a film material with excellent comprehensive performance obtained by combining liquid crystal and polymer. Switchable SPD Film consists of a film containing tiny particles sandwiched between two pieces of glass or transparent plastic. These particles are usually surrounded by liquid or colloidal suspension and coated with transparent conductive material. When current passes through the switchable SPD film, these suspended particles will be arranged in a straight line under the action of the electric field, allowing light to pass through. When the power is off, due to Brownian motion, these particles will be randomly distributed and absorb most of the visible light, making the switchable film opaque or translucent.
