SPD (Suspended Particle Device) films are electrically controlled switchable films, which are widely used in the fields of automobiles, construction, etc. to adjust light. Switchable SPD Film consists of a film containing tiny particles sandwiched between two pieces of glass or transparent plastic. These particles are usually surrounded by liquid or colloidal suspension and coated with transparent conductive material. When current passes through the switchable SPD film, these suspended particles will be arranged in a straight line under the action of the electric field, allowing light to pass through. When the power is off, due to Brownian motion, these particles will be randomly distributed and absorb most of the visible light, making the switchable film opaque or translucent.
