Abstracts

The global Switched-Capacitor Charger market size is predicted to grow from US$ 372 million in 2025 to US$ 753 million in 2032; it is expected to grow at a CAGR of 10.2% from 2026 to 2032.

In 2025, global sales of Switched-Capacitor Chargers reached approximately 390 million units, with an average market price of about USD 0.97 unit, an annual production capacity of roughly 420 million units, and an industry-average gross margin of approximately 40%.

Switched-Capacitor Chargers are high-efficiency battery charging integrated circuits that use flying capacitors, power switch arrays, and fixed or configurable conversion ratios to transfer power from an input source to lithium-ion or lithium-polymer batteries. These devices are commonly designed for high-power direct charging, parallel charging, and charge-pump fast-charging architectures in portable electronics. Typical operating modes include 2:1, 3:1, 4:1, and 1:1 bypass configurations, allowing the system to reduce cable current, improve conversion efficiency, manage thermal rise, and deliver high charging current to the battery. A modern switched-capacitor charger IC usually integrates digital control, I2C communication, ADC monitoring, over-voltage and over-current protection, thermal regulation, reverse-blocking functions, and external protection FET control. This research focuses on switched-capacitor battery charging ICs used in smartphones, tablets, power banks, wireless charging receivers, mobile IoT devices, and other high-power portable electronics, where compactness, charging efficiency, thermal performance, and compatibility with USB PD PPS, UFCS, proprietary fast-charging protocols, and wireless fast-charging systems are key design requirements.
