Switchyard is a switching station that is the central link between the power generating plant and the transmission system. It is a junction that carries the generated power to the required station. It plays a key role in the security of the system. Switchyard can control reactive power devices, which determine power quality. Switchyard comprises assembly of switches, power circuits, breakers, and auxiliary equipment, which are used in transmission and distribution. Switchyard is one of the important constituents of the substation. Hence, proper maintenance of switchyards is necessary for reliability. Switchyard maintenance consists of two types: preventive and breakdown. Breakdown maintenance, also known as corrective maintenance, is carried out due the failure of equipment. Such type of maintenance results in outage of circuit and supply. Preventive maintenance is undertaken to ensure smooth and efficient working of a system or equipment. Maintenance of switchyards consists of other services such as inspection, servicing, and overhauling of system.
