The global Synthetic Aperture Radar (SAR) Satellite market size is predicted to grow from US\$ 1133 million in 2025 to US\$ 1448 million in 2032; it is expected to grow at a CAGR of 3.6% from 2026 to 2032.

Synthetic Aperture Radar (SAR), or synthetic aperture radar, is a high-resolution radar device. Its SAR satellite system, which is carried on a satellite, has become one of the important means of earth observation. SAR satellites use the principle of synthetic aperture to measure the distance by emitting electromagnetic pulses and receiving target echoes, thereby generating high-resolution radar images. It uses the relative motion between the radar and the target to synthesize the smaller real antenna aperture into a larger equivalent antenna aperture by data processing, thereby achieving high-resolution imaging of the ground.

With the development of technology, the resolution of SAR satellites has been continuously improved, from tens of meters in the early days to several meters or even one meter now, which enables SAR satellites to obtain more detailed surface information and meet the needs of more fields. The continuous advancement of SAR satellite technology has made the application of multi-polarization and multi-frequency bands possible, which further enriches the information acquisition capabilities of SAR satellites and improves their application value. The development of interferometric SAR (InSAR) technology enables SAR satellites to monitor surface deformation and conduct three-dimensional terrain mapping, providing more accurate data support for disaster warning, resource exploration and other fields.

The government encourages enterprises to increase R&D investment and promote the innovation and application of SAR satellite technology by formulating relevant policies

and providing financial support. These policies not only promote the rapid development of SAR satellite technology, but also provide strong guarantees for its market expansion.
