The global Synthetic Cutting Oil market size is predicted to grow from US\$ 2563 million in 2025 to US\$ 3045 million in 2032; it is expected to grow at a CAGR of 2.1% from 2026 to 2032.

Synthetic cutting oil is a functional metalworking fluid used in cutting, grinding, drilling, tapping, deep-hole machining, and precision forming processes for materials such as metals, alloys, glass, and ceramics. It is typically formulated with synthetic base oils, synthetic esters, polyethers, extreme-pressure and anti-wear additives, corrosion inhibitors, wetting agents, defoamers, biocides, and stabilizers. The core function of this product is to form a controlled lubrication and cooling interface between the tool, grinding wheel, and workpiece, reducing frictional heat, minimizing tool wear, improving surface quality, removing chips, and inhibiting corrosion of both the workpiece and equipment. Compared with conventional mineral-based cutting oils, synthetic cutting oil places greater emphasis on low misting, low residue, extended sump life, stability, cleanliness, and environmental friendliness. It can be classified by machining intensity into light- and medium-duty cutting, heavy-duty cutting, grinding, deep-hole machining, tapping, and special-material machining. Its main customers include automotive component manufacturers, aerospace companies, machinery manufacturers, mold and die producers, bearing manufacturers, precision electronics companies, glass and ceramic processing companies, and general machining enterprises.

The industry value of synthetic cutting oil comes from the manufacturing sector's sustained demand for higher machining efficiency, longer tool life, and more stable surface quality. Automotive components, aerospace, precision machinery, mold and die, and electronic component manufacturing are upgrading from basic cooling and lubrication toward higher-performance, lower-maintenance, and cleaner fluid systems. Workpieces such as aluminum alloys, stainless steel, titanium alloys, nickel-based alloys, hard materials, glass, and ceramics impose differentiated requirements for

lubricity, cooling performance, corrosion resistance, foam control, and residue control, making it difficult for a single low-end cutting oil to cover all machining scenarios. Future product competition will focus more on formulation stability, material compatibility, sump life, health and safety, and adaptability to centralized coolant systems.

The synthetic cutting oil market is not driven simply by growth in lubricant sales volume. It is deeply tied to upgrades in machining equipment, the penetration of CNC machine tools, automated production lines, and the manufacturing of high-value components. High-speed, high-precision, and continuous machining amplify the impact of cooling and lubrication fluids on tool life, workpiece yield, and downtime costs, making customers more willing to pay a premium for more stable synthetic and semi-synthetic products. Centralized coolant systems and on-site services will push suppliers to shift from packaged product sales toward an integrated 'fluid plus maintenance' model, including concentration management, microbial control, filtration, waste-fluid treatment, and process optimization. As environmental regulations and occupational health requirements become stricter, low-chlorine, low-sulfur, low-odor, low-mist, and easier-to-treat product routes will continue to gain share.

From a regional perspective, both production and consumption of synthetic cutting oil are highly dependent on manufacturing-intensive regions. North America, Europe, and Japan still maintain strong foundations in high-end formulations, aerospace applications, and precision manufacturing customers, while Asia, especially China, South Korea, India, and Southeast Asia, is absorbing incremental demand from the expansion of automotive, machinery, electronics, and general manufacturing. The Chinese market has substantial room for mid- and low-end substitution, but high-end synthetic cutting oil is still constrained by formulation experience, customer certification, and long-term stability validation. In the coming years, market growth is unlikely to appear as explosive expansion, but will more likely be reflected in product mix upgrading, with semi-synthetic products, fully synthetic products, high-performance grinding fluids, difficult-alloy machining fluids, and centralized-fluid supporting services gradually increasing their share.
