The global Synthetic Inositol market size is predicted to grow from US\$ 35.45 million in 2025 to US\$ 53.49 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

In 2025, sales of synthetic inositol reached 4,101 tons, with an average price of \$8,837 per ton.

Synthetic inositol refers to an industrially produced product that converts simple carbon sources (glucose, glycerol, maltodextrin, etc.) into inositol in one step through chemical or biocatalytic means, without using phytic acid. Unlike the traditional 'phytic acid hydrolysis-inositol' process, it features readily available raw materials, low pollution, and high stereoselectivity.

The mainstream process uses food-grade glucose (or glycerol) as the sole carbon source, employing a three-step enzymatic cascade reaction: glucose → glucose-6-phosphate → inositol-1-phosphate → inositol. The entire process requires no high-pressure acid hydrolysis, and the only byproduct is inorganic phosphorus. The glucose consumption is approximately 3.2 t/t inositol. In terms of raw material costs, glucose accounts for 45-50%, enzyme preparations (inositol-1-phosphate synthase, etc.) for 15-20%, fermentation energy consumption and membrane separation for 15%, and manual, environmental, and GMP refining costs for 15-20%.

United States market for Synthetic Inositol is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
