Blood dialysis membrane is a kind of selective through the membrane, with the help of a film on both sides of the blood and the concentration of dialysate direct gradient, osmotic pressure gradient and pressure gradient, make the urea in the blood and liver of creatine, uric acid and other toxins and retention in the body too much moisture diffusion to dialysis fluid, and essential related ions from the dialysate spread to the blood to compensate. Synthetic membranes are made from polysulfone, polycarbonate, polyamide, or polyacryl-polyamide acrylate (PMNA). These membranes are generally relatively biocompatible, except for the negatively charged AN69 polyacrylonitrile membranes.
