The proppant refers to natural sand or artificial high-strength ceramic particles with a certain particle size and gradation. Ceramic proppant (ceramic proppant) is made of bauxite through powder granulation and sintering. It has the characteristics of high temperature resistance, high pressure resistance, corrosion resistance, high strength, high conductivity, low density, low crushing rate , The most widely used.

Coating resin on the surface of sand or ceramsite can further improve the strength and conductivity of proppant. Proppant is a key material in fracturing construction. Synthetic proppants play a vital role in the extraction process by keeping the supplies of natural gas and oil unhindered.
