Systemic autoinflammatory disease drugs are medications used to treat a group of conditions characterized by inappropriate and chronic activation of the body's innate immune system, leading to widespread inflammation in various organs. Unlike autoimmune diseases, which are driven by the adaptive immune system attacking self-antigens, autoinflammatory diseases originate from innate immune dysregulation. Common conditions include familial Mediterranean fever (FMF), tumor necrosis factor receptor-associated periodic syndrome (TRAPS), and systemic juvenile idiopathic arthritis (sJIA). These drugs, often targeting inflammatory pathways, aim to control flare-ups, reduce inflammation, and prevent long-term organ damage.
