Cells required the broth to be changed regularly, necessitating the scientists to first remove the old broth. Researchers realized, however, that the floating cells were often removed along with the old broth. To address this problem, Earle developed a new kind of flask in which to grow the cells. The so called T-flask (named for the glass tubing from which it was blown), could be centrifuged prior to changing broth. Doing so trapped cells in the conical end, preventing them from being sucked out with the old broth.
