Displays are an interface between the user and the application processor. They define the image quality delivered by tablets. Therefore, tablet manufacturers attach high significance to displays. Tablet displays are also connected to the touch screen control, which is directly proportional to the sensitivity of the device. There are two types of display technologies employed in tablet displays: LCD and OLED. LCD-based displays use liquid crystals to project images on the screen, while OLED-based displays, specifically AMOLED displays, are developed using thin-film display technology, in which organic compounds form the electroluminescent material. AMOLED-based displays consist of an active matrix of OLED pixels that generate light on electrical stimulation.

The increasing demand for tablet drives the growth of tablet display market. Factors such as people preference toward electronic equipment, technical advancement and people living standard lead to the growth of market. Additionally, APAC dominates the market and is estimated to continue to become contributor over the forecast period on account of increase in population.
