Tabular alumina has thermal shock resistance and high thermal volume stability, owing to its low open porosity, explicit microstructure and large crystals with locked spherical pores, entrapped on re-crystallization throughout rapid sintering. It has high mechanical strength, high refractoriness, high chemical purity, abrasion resistance, and high corrosion resistance. Approximately, for more than 70 years, tabular alumina has been used in high-performance refractory materials for various applications such as foundry, steel, ceramics, and oil and gas.
